Create and manage user stories, projects, sprints, epics, test scripts	✓	✓	✓
Use chatter feed to collaborate around a user story and keep track of decisions	✓	✓	✓
Run manual functional test scripts on user stories	✓	✓	✓
Use sprint wall and work manager dashboards with backlog, backburner, sprints and other configurable panels for user story management	✓	✓	✓
Leverage Salesforce report and dashboard capabilities to monitor the status and progress of user stories	✓	✓	✓
ALM Integration: Bi-directional integration for Jira and Azure DevOps Import user stories from: Rally, Agile Accelerator, VersionOne	✓	✓	✓
Add commits to user stories: Files within those commits will automatically be deployed when promoting the User Stories		✓	✓
Add Manual, Data, Custom Setting, Deletion, Script or Callout Steps to a User Story to make sure also non-metadata steps are also completed before or after the deployment of a feature		✓	✓
Run compliance tests for user stories (available with Compliance Hub)		✓	✓
Set up quality gates with Salesforce configuration to provide release managers intel if a user story is completed, approved, tested and ready to be released		✓	✓
Run apex tests for user stories		✓	✓
Perform static code analysis on User Stories		✓	✓
Keep your business context and associate Metadata and Git Metadata changes on User Stories		✓	✓
Overlap Awareness: Copado will detect potential conflicts when same metadata items are selected against multiple user stories		✓	✓
Quick check for potential conflicts of specific metadata with other User Stories (only with git)		✓	✓
Use sprint wall and work manager dashboards with backlog, backburner, sprints and other configurable panels		✓	✓

## Features by User Type

	<b>Guest License</b> \$15 / user / month	<b>User License</b> \$250 / user / month	<b>Admin License</b> \$350 / user / month
--	---	---	--

Promote: Select a set of user stories that are approved for promotion, and Copado will create 1 single deployment that combines all the changes automatically		✓	✓
Back promote user stories to lower environments		✓	✓
Validate user story commits		✓	✓
OAuth authentication: Authenticate unlimited orgs using OAuth		✓	✓
Git version control: Deploy from Git, compare branches, commit, rollback, etc			✓
Automated Git backups: Take a snapshot of all the metadata on an org into a Git repository/branch of your choice			✓
Deployment of users: Select users from a source org and deploy them to another org. No more data-loader and vlookup to map all the Id fields			✓
Deployment of profiles and permission sets: Just select profiles/permission sets and Copado will deploy them all (including FLS, OLS, tab visibility)			✓
Deploy to multiple orgs: Create a deployment and deploy it to an unlimited amount of orgs in parallel and validate changes before deploying them			✓
Deployment of metadata: Like change-sets or ant-scripts but ten times faster. You can search, filter and select any lightning metadata faster			✓
Deployment of translations: Just select the language and Copado will deploy all translated items (fields, labels, tabs, etc.)			✓
Pre/Post deployment jobs: Run Apex test on source before or run a Selenium test on destination after a deployment			✓
Org & commit differences: Compare 2 orgs, or an org and a commit, check the differences and deploy all or just a selection			✓
Scheduling of deployments: Prepare a deployment and schedule it to run at any date/time in the future			✓
